EDUCATION

Shri Vaishnav Vidyapeeth Vishwavidyalaya

Indore, MP

Bachelor of Technology in Computer Science Engineering

Sep 2021 - July-2025

Languages: Python, Java, HTML/CSS, SQL | Tools: Git, GitHub, IntelliJ, MySQL, Microsoft 365, Streamlit

Libraries: Pandas, NumPy, Matplotlib, Seaborn, OpenCV, Scikit-learn, NLTK, SpaCy, TensorFlow, Keras, Flask, YOLOv8

WORK EXPERIENCE

AI/ML Intern, Linkites Infotech

Apr 2025 – Jun 2025

- Engineered a custom YOLOv8 object detection pipeline to detect cricket bats and toes, achieving 92% mAP and reducing false positives by 25% through optimized IoU and NMS tuning.
- Manually labeled ~9,000 images using Roboflow to build a high-quality cricket bat and toe detection dataset, ensuring precise annotations for effective model training.
- Designed and fine-tuned a multi-class detection model to distinguish between visually similar objects (bat vs. toe), increasing class-wise detection precision by 35% in real-world cricket footage.
- Delivered real-time detection visualizations with OpenCV, improving debugging and enhancing model interpretability for non-technical stakeholders.

AI/ML Intern, Allsoft Solutions

Jan 2025 - May 2025

- Utilized Python (Pandas, Seaborn, Matplotlib) to analyze 600K+ U.S. flight records, identifying weather and carrier delays as top disruption causes with 85% correlation accuracy.
 - Designed and deployed interactive Tableau dashboards, reducing manual reporting time by 60% and enhancing stakeholder visibility into airline performance trends.
 - Engineered a robust data preprocessing pipeline that improved data quality by 40%, enabling cleaner insights for predictive delay analysis.
-

PROJECTS

SMS Spam Classification

- Developed an SMS Spam Classifier using 10 different machine learning models (e.g., Logistic Regression, Naive Bayes, SVM), achieving up to 98% accuracy in spam detection.
- Engineered a full NLP pipeline including stopword removal, lemmatization, and TF-IDF vectorization, boosting model precision by 15% over raw text baselines.
- Conducted model benchmarking using confusion matrices, ROC-AUC curves, and cross-validation, enabling data-driven selection of the most efficient classifier.

Algo Trading Bot

- Engineered a multivariate LSTM model in Keras to forecast stock prices, using moving averages, volume, OHLC, achieving ~38.6% total gross return over the test period.
 - Implemented sliding-window preprocessing and robust backtesting across 3 strategies, showcasing LSTM's superior performance in cumulative returns and Sharpe ratio.
 - Developed a full data-to-model pipeline (data windowing, feature scaling, LSTM network with 500+ hidden units and 50% dropout, Adam optimizer), enabling deployment-ready forecasting and clear, plotted comparisons of strategy returns in test analysis.
-

CERTIFICATIONS

- Cloud Application Developer, IBM
- NPTEL Big Data Computing, IIT Kanpur
- NPTEL Cloud Computing and Distributed Systems, IIT Kanpur
